# 1. INTRODUCTION

## 1.1 Project Overview

This project implements an Employee Training Records solution in ServiceNow. Each training record is linked to an employee through a reference field to the ServiceNow **sys\_user** table. Employee-related information such as department can then be accessed through dot-walking for easier reporting and record visibility.

The project also establishes role-based access control using an **HR Manager** role and Access Control Lists (ACLs). The solution is validated using user impersonation to confirm that authorized users can view and edit the training records while other users cannot access the table.

## 1.2 Purpose

The purpose is to provide a structured and secure way to create, import, relate, report on, and protect employee training information using key ServiceNow platform features.

# 2. IDEATION PHASE

## 2.1 Problem Statement

Link each training record to an employee and pull employee details such as department into the record so that training information can be accessed and reported efficiently. The project also needs controlled access so that only authorized users can work with the Employee Training Records table.

## 2.2 Empathy Map Canvas

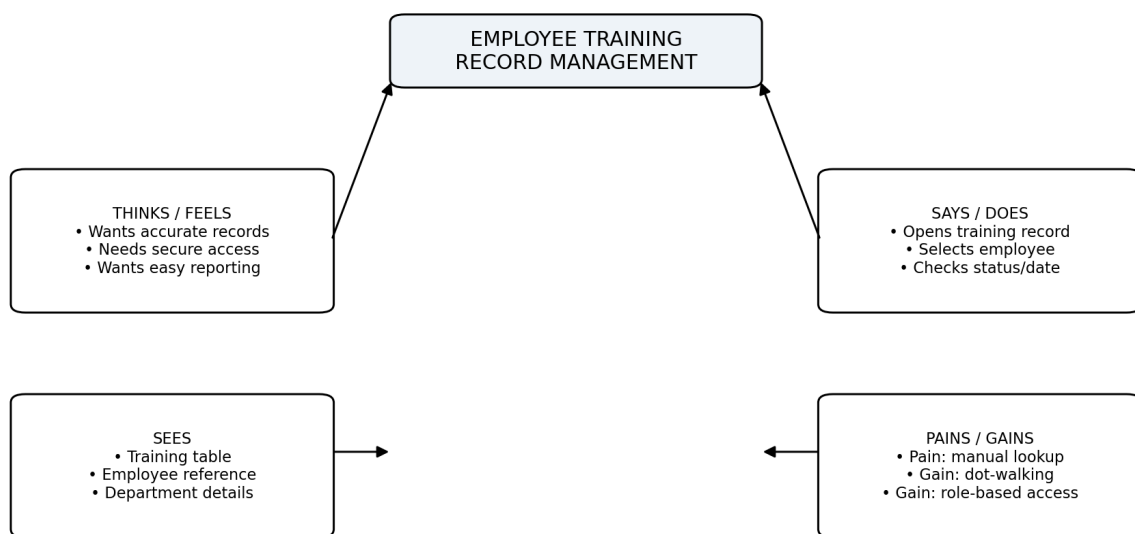

Figure 1. Empathy Map Canvas for the Employee Training Records use case.

## 2.3 Brainstorming

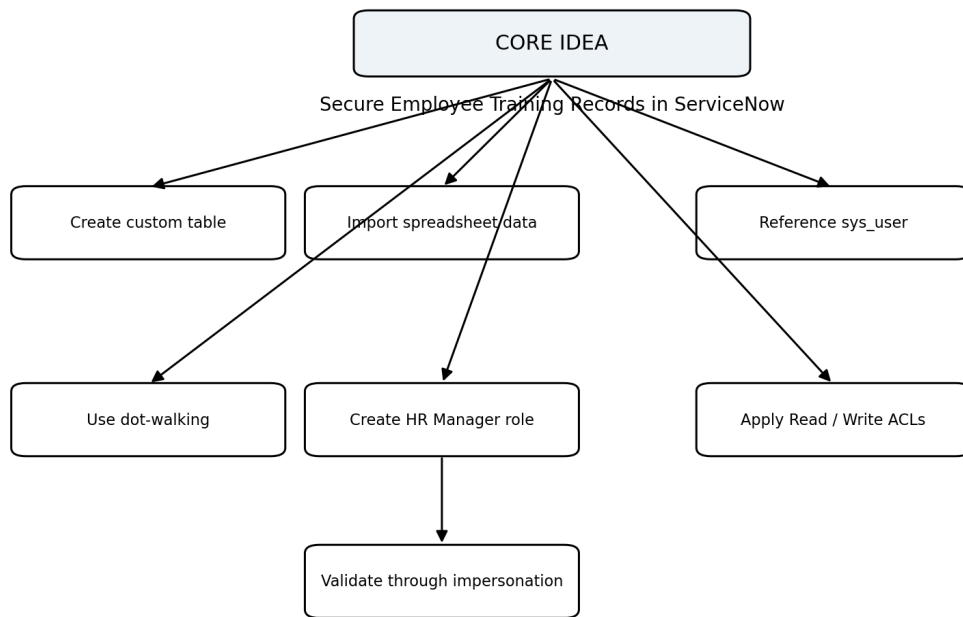

Figure 2. Brainstorming flow derived from the stated project activities.

## 3. REQUIREMENT ANALYSIS

### 3.1 Customer Journey map

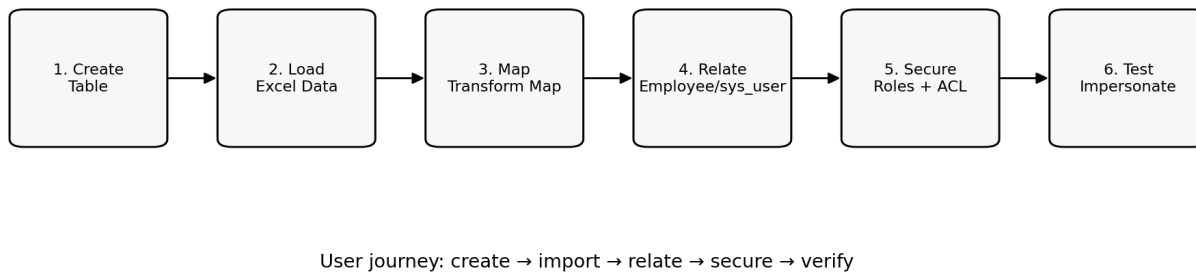

Figure 3. Customer/user journey through the proposed ServiceNow workflow.

### 3.2 Solution Requirement

| Requirement     | Specification                                         |
|-----------------|-------------------------------------------------------|
| Custom table    | Employee Training Records table                       |
| Training Name   | String                                                |
| Completion Date | Date                                                  |
| Status          | Choice                                                |
| Employee        | Reference to sys_user                                 |
| Import          | Spreadsheet with four fields using System Import Sets |
| Mapping         | Transform Map with field mappings                     |
| Related data    | Employee department through dot-walking               |
| Security        | HR Manager role with Read and Write ACLs              |
| Validation      | Impersonation of users to verify access               |

### 3.3 Data Flow Diagram

### Data Flow Diagram

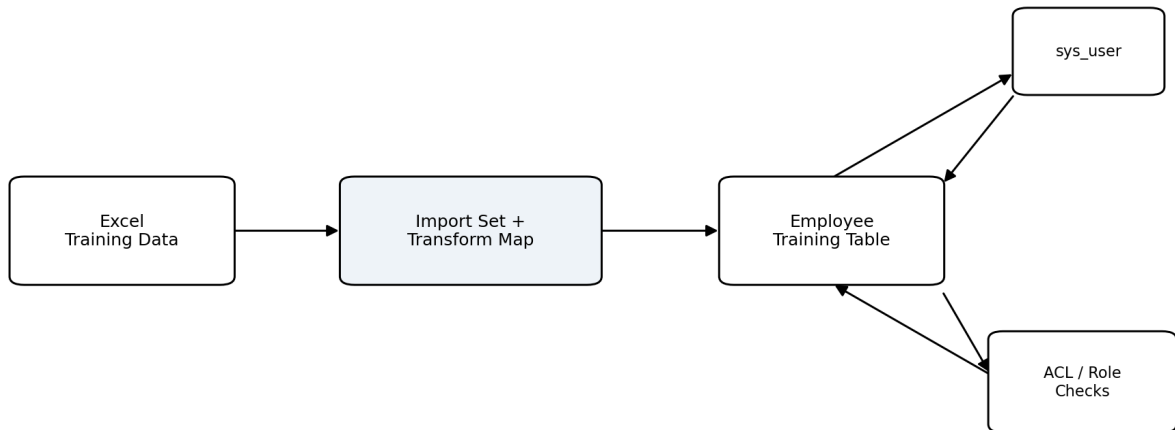

Figure 4. Data flow from spreadsheet import through ServiceNow data and security validation.

## 3.4 Technology Stack

| Technology / Feature | Use in Project                           |
|----------------------|------------------------------------------|
| ServiceNow           | Application platform and user interface  |
| Custom Table         | Stores Employee Training Records         |
| sys_user             | Reference table for employees            |
| System Import Sets   | Loads spreadsheet data                   |
| Transform Maps       | Maps imported fields to target fields    |
| Dot-Walking          | Accesses employee department information |
| Roles                | Provides role-based authorization        |
| ACLs                 | Controls Read and Write access           |
| Impersonation        | Tests access for different users         |
| Spreadsheet (.xlsx)  | Source data for import                   |

## 4. PROJECT DESIGN

### 4.1 Problem Solution Fit

The solution directly addresses the stated problem by combining employee reference data, imported training information, dot-walking, and access control. The Employee field connects each record to sys\_user, while dot-walking exposes department information without requiring a separate manual employee lookup.

The HR Manager role and table-level Read/Write ACLs provide the security layer. Impersonation is used as the validation method to confirm that access differs according to the assigned role.

### 4.2 Proposed Solution

1. Create the Employee Training table and add Training Name, Completion Date, Status, and Employee fields.
2. Add Status choices through the Dictionary Entry.
3. Prepare the spreadsheet and load it through System Import Sets.
4. Create a Transform Map and map the imported fields.
5. Use Employee dot-walking to access Department.
6. Create the backup user and HR Manager role.
7. Assign the role to the user and expose the application/module as required.
8. Elevate to security\_admin and create Read and Write ACLs.
9. Impersonate users and verify the expected access.

### 4.3 Solution Architecture

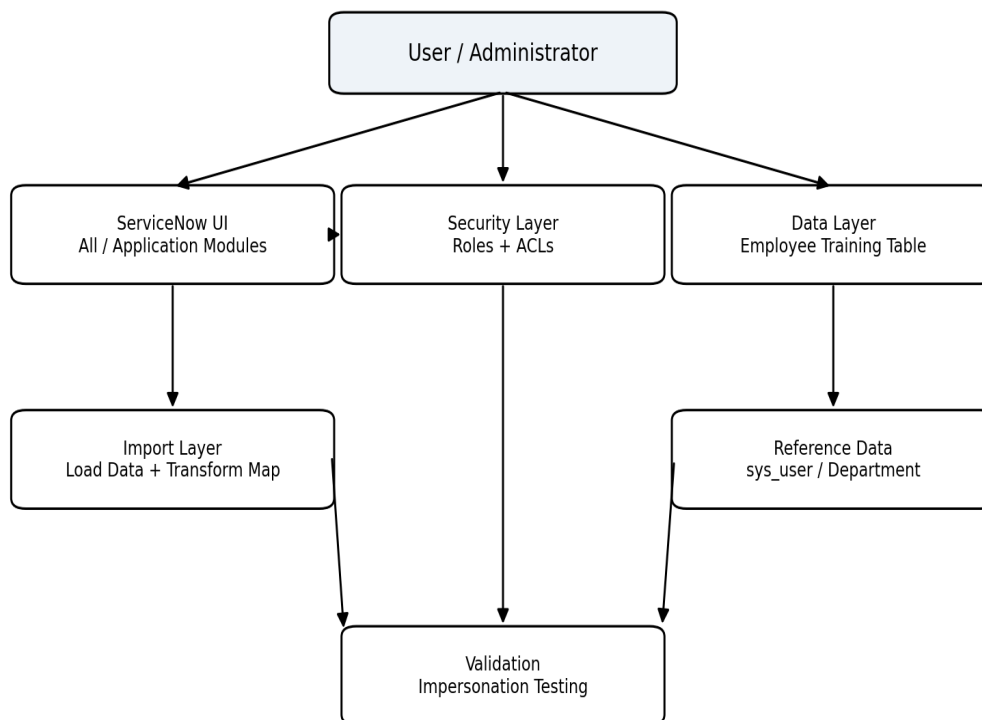

Figure 5. Solution architecture for the Employee Training Records implementation.

## 5. PROJECT PLANNING & SCHEDULING

### 5.1 Project Planning

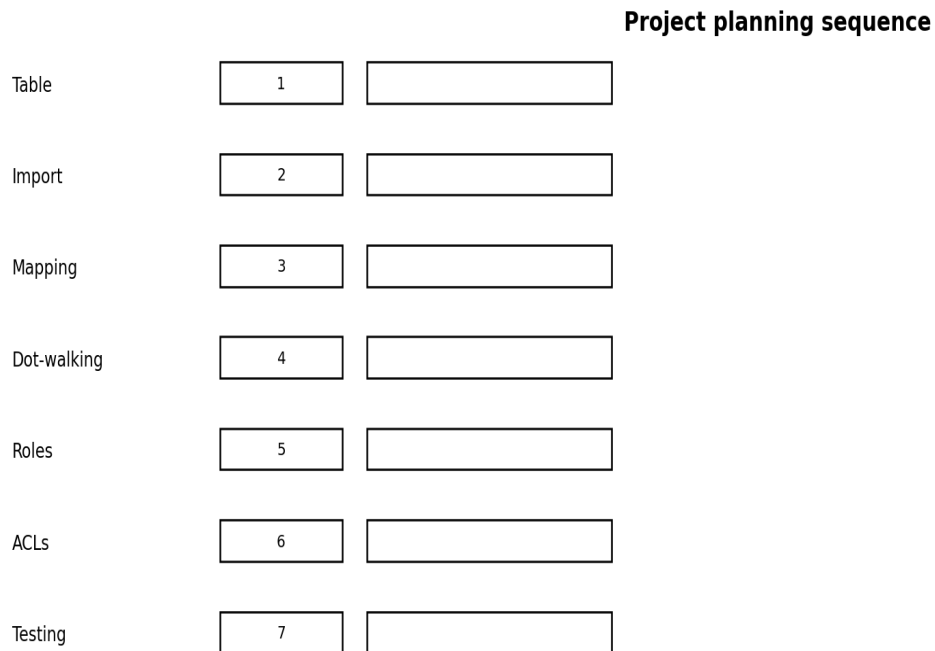

Figure 6. Sequential project planning based on the six milestones and activities supplied.

The implementation is organized into six major milestones: Tables, Import Data, Dot-Walking, Roles and User Creation, ACL, and Result/Testing. Each milestone depends on the completion of the previous configuration step.

## 6. FUNCTIONAL AND PERFORMANCE TESTING

### 6.1 Performance Testing

Testing focuses on functional access and configuration behavior described in the project. The important checks are table visibility, field visibility/editability, role assignment, ACL behavior, import mapping, and dot-walking of employee department information.

| Test ID | Test Scenario                                     | Expected Result                                           | Status |
|---------|---------------------------------------------------|-----------------------------------------------------------|--------|
| TC-01   | Open Employee Training Records as authorized user | Table is visible                                          | Pass   |
| TC-02   | Open an employee training record                  | Training fields are available                             | Pass   |
| TC-03   | Use Employee dot-walking to display Department    | Department can be accessed in the list/form configuration | Pass   |
| TC-04   | Impersonate user with HR Manager role             | User can see and edit permitted fields                    | Pass   |
| TC-05   | Impersonate another user without required access  | Employee Training Records table is not visible            | Pass   |
| TC-06   | Import spreadsheet using Transform Map            | Four source fields are mapped into target records         | Pass   |
| TC-07   | Apply Read ACL                                    | Authorized role receives read access                      | Pass   |
| TC-08   | Apply Write ACL                                   | Authorized role receives write access                     | Pass   |

The supplied project description states that the authorized impersonated user can see and edit the fields, while another impersonated user cannot see the table. These stated outcomes form the basis of the functional test expectations.

# 7. RESULTS

## 7.1 Output Screenshots

Employee Training Records — Representative Output

| Training Name                                                                                           | Completion Date | Status      | Employee    | Department |
|---------------------------------------------------------------------------------------------------------|-----------------|-------------|-------------|------------|
| ServiceNow Basics                                                                                       | 2026-09-10      | Completed   | Backup User | HR         |
| ACL Configuration                                                                                       | 2026-09-15      | Completed   | Backup User | HR         |
| Import Sets                                                                                             | 2026-09-20      | In Progress | Employee    | IT         |
| Illustrative representation based on the project requirements;<br>not a captured ServiceNow screenshot. |                 |             |             |            |

Figure 7. Representative Employee Training Records output showing the requested fields and dot-walked Department column. This is an illustrative representation, not a captured ServiceNow screen.

The final result described in the project is that authorized users can search Employee Training Records and see/edit the permitted fields, while another user without the required access cannot see the table.

# 8. ADVANTAGES & DISADVANTAGES

| Advantages                                                            | Disadvantages                                                           |
|-----------------------------------------------------------------------|-------------------------------------------------------------------------|
| Employee reference keeps training records linked to user information. | Initial configuration requires several ServiceNow administration steps. |
| Dot-walking reduces repeated manual lookup of department information. | Information field mapping can affect imported records.                  |
| Import Sets support structured spreadsheet data loading.              | ACL configuration requires elevated administrative privileges.          |
| Roles and ACLs support controlled access.                             | Testing must cover different user roles to confirm access behavior.     |
| Impersonation provides a practical way to validate access.            | The project depends on correct sys_user reference data.                 |

# 9. CONCLUSION

This project demonstrates the process of importing employee training information into ServiceNow using Import Sets and Transform Maps, linking records to employees through the sys\_user reference, and using dot-walking to access related department information. It also demonstrates role-based security through an HR Manager role and Read/Write ACLs. The use of impersonation provides a direct method for validating the expected access behavior.

# 10. FUTURE SCOPE

The solution can be extended by adding additional training attributes, automated notifications for completion dates, dashboards for HR reporting, more granular field-level ACLs, approval workflows, scheduled data imports, and richer reporting based on department and training status. These extensions are potential future enhancements and are not described as completed features in the supplied project details.

## 11. APPENDIX

### Source Code (if any)

No source code was supplied in the project details. The implementation is described as a ServiceNow platform configuration using tables, import sets, transform maps, roles, ACLs, dot-walking, and impersonation.

### Dataset Link

No external dataset link was supplied. The project specifies creating a spreadsheet containing Training Name, Completion Date, Status, and Employee for import.

### GitHub & Project Demo Link

No GitHub repository or project demo link was supplied in the provided project details.

**Document basis:** Project details supplied by the user and the uploaded Project Report Format template. The report preserves the template's section order and headings.
