

Acceptance Testing UAT Execution & Report Submission

Date	03-10-2026
Team ID	6ab75bec02319e850fce1837
Project Name	Import Data using Transform Maps (Spreadsheet)
Maximum Marks	4

1. Purpose of Document

This document summarizes the User Acceptance Testing (UAT) coverage for the ServiceNow **Employee Training Records** initiative. The project links each training record to an employee, supports importing training data, uses dot-walking to display employee department information, and applies role-based Access Control Lists (ACLs) to secure the table.

2. Implementation Activity Analysis

This section summarizes the major configuration activities completed for the ServiceNow solution based on the provided project procedure.

Milestone	Activity	Outcome
1. Tables	Create Employee Training table and fields	Configured
2. Import Data	Load XLSX data and create import set	Configured
2. Import Data	Create Transform Map and field mappings	Configured
3. Dot-Walking	Display Employee Department from sys_user	Configured
4. Roles & Users	Create backup user and HR Manager role	Configured
4. Roles & Users	Assign HR Manager role to backup user	Configured
5. ACL	Create Read and Write ACLs for HR Manager	Configured

3. Test Case Analysis

The test cases below reflect the testing result described in the project document, including impersonation and ACL access validation.

Test Section	Total Cases	Not Tested	Fail	Pass
Table Creation & Fields	1	0	0	1
Data Import & Transform Map	2	0	0	2
Dot-Walking / Department	1	0	0	1
User & Role Configuration	2	0	0	2
ACL Read Access	1	0	0	1
ACL Write Access	1	0	0	1
Impersonate HR Manager	1	0	0	1
Impersonate Other User	1	0	0	1

4. Result Summary

The project procedure reports that when the **HR Manager** role is used through impersonation, the Employee Training Records table can be accessed and the configured fields can be viewed and edited. When another user without the required role is impersonated, the table is not visible. This demonstrates the intended role-based access restriction.

5. Configured Project Elements

1. Employee Training table with Training Name, Completion Date, Status, and Employee fields.
2. Employee field references the ServiceNow sys_user table.
3. Status field configured as a Choice field with status choices.
4. Training data imported from an XLSX file through System Import Sets.
5. Transform Map used to map imported columns to Employee Training fields.
6. Dot-walking used to bring Employee Department information into the list view.
7. HR Manager role assigned to the backup user.
8. Read and Write ACLs applied to the Employee Training Records table.

6. Conclusion

This project demonstrated the process of creating and importing Employee Training Records in ServiceNow, using dot-walking to access related employee information, and enforcing data security through role-based ACLs. The final testing scenario validates that authorized users receive the intended access while users without the required role cannot access the table.
