

Jobs-to-be-Done / Problems

- Create training records linked to employees.
- Import training data accurately.
- Show employee Department for easier reporting.
- Allow HR Manager users to read and edit records.
- Prevent other users from seeing the protected table.

Triggers

- Need to report training by employee/department.
- Need to import multiple training records.
- Need to protect employee training information.
- Need to validate access for different users.

Emotions: Before / After

- Before: manual effort, limited context, access concerns.
- After: clearer reporting, structured records, controlled access.

Problem Root Cause

- Training records need a relationship to employee information.
- Department exists on the related sys_user record.
- Access must be controlled through role-based ACLs.
- Without proper configuration, reporting and security requirements are not met.

Your Solution

- ServiceNow Employee Training Access Control.
- Create table with Training Name, Completion Date, Status and Employee reference.
- Import XLSX data through System Import Sets and Transform Maps.
- Use Employee dot-walking to expose Department.
- Create HR Manager role and assign it to the backup user.
- Create Read and Write ACLs and validate with impersonation.

Customer Behaviour

- Create the Employee Training table.
- Load XLSX data using Import Sets.
- Map fields with Transform Maps.
- Configure dot-walking and list views.
- Create users/roles and configure ACLs.
- Impersonate users to verify access.

Channels of Behaviour

- ONLINE / SYSTEM: ServiceNow All menu, tables, User Administration and ACL configuration.
- OFFLINE / SOURCE: XLSX spreadsheet prepared with Status and Employee fields.
- VALIDATION: Impersonate authorized and other user permissions.
