Project Name	Import Data using Transform Maps (Spreadsheet)
Maximum Marks	2 Marks

Proposed Solution Template:

Import Data using Transform Maps (Spreadsheet)

2 Marks

Project team shall fill the following information in the proposed solution template.

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	Link employee training records to employees and pull employee details such as Department into the record for easier reporting. The solution must also control access to Employee Training Records using roles, ACLs and impersonation.
2.	Idea / Solution description	Create an Employee Training table with Training Name (String), Completion Date (Date), Status (Choice) and Employee (Reference to sys_user). Import XLSX data through System Import Sets and Transform Maps, use dot-walking to display Employee.Department, then create an HR Manager role and Read/Write ACLs and validate access by impersonating users.
3.	Novelty / Uniqueness	Combines ServiceNow reference fields, dot-walking, Import Sets, Transform Maps, role-based ACLs and impersonation in one employee-training workflow. The Employee reference connects each training record to existing sys_user information instead of duplicating employee details.
4.	Social Impact / Customer Satisfaction	Helps HR users maintain structured training records, find employee and department information more easily, and use consistent access controls. Authorized users can view and edit the records while other users are prevented from seeing the protected table.
5.	Business Model (Revenue Model)	No separate revenue model is specified in the project requirements. The solution is a ServiceNow platform configuration intended to improve internal HR data management, reporting and security.
6.	Scalability of the Solution	The table and import workflow can support additional employee training records and employees. The reference-based design keeps employee information linked to sys_user, while roles and ACLs provide a reusable access-control approach as usage grows.
